Repair V2.9.1.1 Format Flashdisk Write-protect .zip

## Water Pump Belt Tension –

700 / 800 Liberty™ Engines

The water pump belt on 600 XC Dlx, 600 RMK, & 700 domestic twins snowmobile engines should be inspected every 1500 miles. Belts should be inspected by measuring the width at several locations around the belt. Belt width at any location should not be thinner than .250" (6.35mm). Replace the belt if you notice any loose cords, broken cracked or missing cogs, and variations in width. If the water pump belt fails, serious engine damage could result. Nominal thickness of a new belt should be approximately .345" (8.75mm).

Check belt tension by rotating crankshaft 1/8 turn at a time. The tension should be equal at all points of rotation.

Replace if width is less than .25" (6.35mm). Nominal new width is .345" (8.75mm).

1. A weight is needed to test belt deflection. Construct a weight out of wire and weights such as thick washers. Use the illustration to assist you . The finished weight should weigh 2 lbs.

2. Measure the belt deflection using the following procedure:

   a. Hang weight midway between pulleys. Weight must hang free and not rest on any part of machine.

   b. Lay a straight edge or straight piece of stiff material (steel is suggested) across the top of both pulleys. The straight edge should measure approximately 1/8" x 8" x 1".

   c. Measure the gap between the belt and the straight edge at the point where the weight is hanging.

   d. Measured distance must be between .1" and .25". If the measured distance is more than the specification, try another waterpump belt.

NOTE: Do not use tools to assemble belt on pulleys. Damage can occur which could shorten belt life. Before installing new belt, check pulley teeth, remove all foreign material, dirt, and oil. Never install a used belt on a different engine. Install belt so writing on the belt can be read from the right side of the machine.

Weight Construction

.062" to .090" Wire Suggested

Wide Enough to Span Belt

Weight should equal 2 lbs.
